Haines City, Florida

2024 MULTI-MODAL TRANSPORTATION IMPACT FEE STUDY

EXECUTIVE SUMMARY

This report documents a study to replace Haines City's Road Impact Fee with a Multi-Modal Transportation Impact Fee. Haines City's current road impact fee is based on a 2004 technical study, and the adoption ordinance provides for an annual adjustment to the fee rates based on the annual construction index for municipal services published in the Engineering News Record, and a review of the technical study at least every five-years. While indexing has occurred, the technical study has not been updated to reflect current costs, growth rates, plans, policies, or other technical issues. This 2024 update study was undertaken by CivilSurv Design Group, Inc. through subconsultants W.E. Oliver, P.E., LLC, and Vanasse, Hangen, Brustlin, Inc.

The City's current fee schedule, most recently adjusted in December, 2023, is a single-district fee schedule with a fee of \$1,482.49 per single-family dwelling. The City also collects, on behalf of Polk County, it's additional transportation impact fee. Polk County adopted an updated fee schedule in March, 2023, effective on June 30, 2023, and the fees will increase annually by \$270 to \$3,460 on June 30, 2026. The existing transportation impact fees (\$4,656 combined City and County fee for a 2,000 s.f. home) are considerably lower than those of surrounding communities.

Impact fee methodologies have evolved since 2004. State laws have been passed requiring use of current information, and encouraging creative approaches to support local economic development and land development programs. The 2004 methodology did not incorporate any such features, and this update provided an opportunity for the City to review its goals for improving the transportation system to accommodate growth that is occurring, review and update assumptions used in previous impact fee studies, and to incorporate several changes into the calculation of the impact fees.

Changes in calculation methodologies and data inputs from the 2004 impact fee study include:

Higher unit cost to build roadway capacity: The 2004 fee calculations estimated the cost of constructing new roads of \$465 per vehicle-mile of capacity. Recent City and County road construction experience and anticipated future improvements have led to values on the order of \$613.08 per vehicle-mile of capacity.

New land uses in Fee Schedule: Additional land uses and refinements of land uses have been added into the fee schedule, including size-graduations for single-family homes, nursing homes, coffee/doughnut shop, and "passive" vs "active" warehousing uses. These uses reflect updated information from the latest ITE <u>Trip Generation</u> reference (11th Edition, 2021) and National Household Travel Survey.

Consideration of regional as well as local circulation needs

Haines City's limits are very irregularly shaped, and there are areas surrounding the City that are contemplated for annexation. Consequently, this study has considered a subarea slightly larger than the City limits on which to base a substantial portion of the fee. Beyond that subarea, the

provisions of Polk County's 2023 transportation impact fee have been incorporated -- creating a fee schedule that includes County and City transportation system needs. State highway needs were excluded from the fees. This approach establishes a "maximum" potential fee for City and County facilities, against which other transportation system funding revenues are credited. The City fee rates are the net result, from which the Polk County fee can be remitted to the County.

Analysis of transportation plan and recent growth forecasts in the Haines City subarea has led to an estimated annual average growth in travel of 48,157 vehicle-miles. To expand the non-State transportation system serving the City at a pace that preserves the desired quality of service goal would cost an estimated \$42.3 million per year. Recent estimated funding levels for system expansion have been approximately \$14.0 million per year, which includes County transportation impact fees and \$3.0 million per year of County motor fuel tax revenues. The City's existing road impact fee program currently generates approximately \$3.8 million per year. An assumption in these estimates is that Polk County will allocate its transportation impact fees and motor fuel tax revenues to the City environs in proportion to its generation of revenues.

Two fee schedule alternatives were developed in this study to reflect updated costs, expected rates of growth, and two alternative quality of service goals for a larger "traffic shed" area. The first quality of service goal reflects the County's current mobility fee revenue program, which allows increased congestion in the "shed" area. The second fee schedule considered a better quality of service goal in the Shed area – the same as is proposed within the City.

The first fee alternative is estimated to generate \$22.6 million per year in total City and County transportation impact fees. Combined with County motor fuel taxes directed to building transportation infrastructure yields a potential annual funding of \$25.3 million. It is noted that the \$25.3 million falls short of the \$42.3 million noted above because some of the travel within the City is attributable to development outside the City, which does not pay the City Fee. The City would use the funds collected from the fee to implement improvements identified in the CityView/SAP plan (which serves as the City's Local Government Comprehensive Plan) with priorities indicated by advancement of selected improvement into the City's Capital Improvement Program.

The second fee alternative would generate more revenues and deliver better quality of service for both the City and County, but it cannot be adopted since it assumes that Polk County would also fund the better level of service goals in the "shed" area.

Since the proposed fee increase exceeds 50 percent of the current fee, "extraordinary conditions" must be found by the City Commission in two public hearings. The extraordinary conditions we have found include:

- The long time since the fee technical study for a fee was completed,
- Extraordinarily high growth rates in and around Haines City compared to other areas of Polk County,
- Roadway congestion in the Haines City area exceeding that in other areas of Polk County,
- Updates/changes to the City's Comprehensive Plan Transportation Element, and
- Increases in facility implementation costs since the 2004 study was completed.

Haines City, Florida

2024 Multi-Modal Transportation Impact Fee Study

1. Introduction

Impact fees are a way for local governments to involve new developments in funding a portion of the transportation infrastructure needs that new developments create in a community. ⁽¹⁾ In contrast to historical (and inconsistent and unpredictable) "proportionate share" methods of addressing the transportation impacts of developments, impact fees are viewed as predictable, equitable, and fair, creating a level playing field for developers⁽²⁾. If developed in concert with community transportation goals, they are an indication that a community takes seriously the delivery of a transportation system that is responsive to community needs.

Multi-Modal Transportation Impact Fees are one-time, up-front charges for a portion of the transportation system needed to serve a development at the desired quality of service. The fee is paid at the time certificates of occupancy are issued. Essentially, transportation impact fees require new development that adds travel to the transportation system pay an appropriate share of the capital facilities required to serve that development.

This 2024 Multi-Modal Transportation Impact Fee Study was undertaken by CivilSurv Design Group, Inc., through sub-consultants W.E. Oliver, P.E., and Vanasse Hangen Brustlin, Inc. in response to requirements of Florida Statutes that such fees be developed using the "most recent and localized data". Haines City's most recent study was undertaken in 2004, whereas the City's impact fee ordinance and State law requires review, update, and endorsement of its fees at least every five years to address statutory requirements.

Mobility strategies in Haines City are shifting from those of a small town to a busier, suburban and even urban environment. The transportation system needed to serve an urban/suburban environment includes the need to develop a network of facilities for vehicular circulation, sidewalks, bicycle facilities, parking, and features to support public transportation. While transit and rail are not part of the current adopted transportation plan, the community is also anticipating the possible future extension of SunRail from Poinciana. Thus, it desires to better position itself to address routine transportation system operational and maintenance needs and to respond to forecasted growth. Thus, this study considered the current transportation revenue

- (1) Florida Statutes 163.31801
- (2) "Impact Fees and Housing Affordability: A Practitioners Guide", Bowles, L.K., and Nelson, A.C., 2008.

program, and developed fee schedules for City Commission consideration in light of these goals.

2. Recent Growth Trends

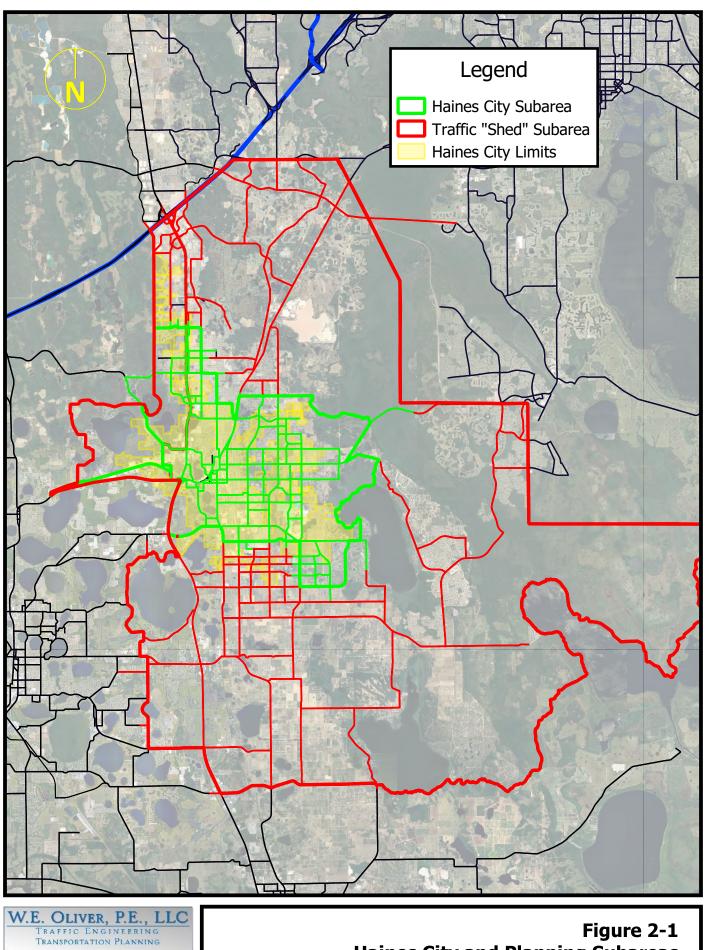

Growth in Haines City and surrounding areas since 2015 can only be described as meteoric. This study, and this discussion, has considered a "traffic-shed" area larger than the Haines City limits because of the irregularity of the City limits, because circulation within and through the City also depends on surrounding roads and connections, and because traffic from the surrounding areas makes use of roads within the City. The traffic-shed ("Shed") area roughly matches Polk County's legacy East (Transportation Impact) Fee District. This report also references a smaller "Haines City subarea", which roughly aligns with the City's boundaries. Because of the irregularity of the City Limits and established traffic, the Haines City subarea included some roads in the City's immediate surrounding area. Both areas are illustrated in Figure 2-1.

While most communities in Florida consider growth rates on the order of two to three percent per year to be typical, the Haines City area has experienced a recent growth rate in housing of 6.7 percent per year, and growth in traffic volumes on US 27, the primary arterial road servicing the area, has increased at a rate of 4.5 percent per year from 2018 to 2022. Traffic growth monitoring reports from the Polk Transportation Planning Organization (TPO), which includes major roads throughout the County, also indicates the Haines City subarea experiencing a 7.2 percent per year growth rate from 2019 through 2023. These growth rates are illustrated in Figure 2-2.

Of interest, too is the comparison of the growth rate in the Haines City area compared to the rest of Polk County. Two of the graphics in Figure 2-2 illustrate growth not only the Haines City subarea, but for the balance of Polk County as well. These graphs make clear that the Haines City subarea is experiencing extraordinary growth rates.

A recent newspaper article in the Orlando Sentinel identified Polk County as one of the fastest-growing Counties in the nation, with much of that growth occurring in the northeastern portion of the County – as verified by the County's property tax roll data.

The fourth graph in Figure 2-2 compares the degree of congestion, as measured by measuring the quantity of travel experiencing various volume:capacity ratios in the Haines City area as opposed to the balance of Polk County. The blue vertical bars representing the Haines City area are more heavily distributed toward the higher volume:capacity ratios, indicating Haines City drivers are experiencing more congested conditions than drivers in other areas of Polk County. These conditions would support a finding of extraordinary conditions occurring in the Haines City area.

3. Growth Forecast for Multi-Modal Transportation Impact Fee Study

The University of Florida Bureau of Economic and Business Research (BEBR) has been charged by the State Legislature to develop county-wide population forecasts to be used for planning

purposes. Their 2023 forecasts for Polk County are illustrated in Figure 3-1. They indicate a faster growth rate of 2.28 percent per year in the early years (2022-2030) of the forecast, which slows to an overall 1.55 percent per year from 2022 through 2050.

The Polk County Transportation Planning Organization (TPO) allocates this growth to traffic analysis zones (TAZ's), which are smaller geographic

subareas, throughout the County. There are 845 TAZ's in Polk County. Since the TPO allocates growth to TAZ's, the amount of growth in the area surrounding Haines City can be quantified.

For the "traffic-shed" subarea, the TPO has assigned a growth rate of 2.56 percent per year, from 2015 through 2045, resulting in a traffic shed area population forecast of 250,032, housed in 112,617 residential dwelling units.

Haines City has also commissioned a transportation plan study for the City. This plan was adopted in 2021, and its technical analysis was based on a year 2040 countywide population estimate of 987,364, which is consistent with current BEBR forecasts. A traffic shed area year 2040 population forecast of 234,712 was allocated, housed in 112,374 residential dwelling units. This population growth rate from 2015 to 2040 is 2.82 percent per year.

As mentioned previously, the growth rate in residential dwellings county-wide has been 2.9 percent per year from 2019 to 2023, and in the traffic shed area dwelling units have been added at a rate of 6.7 percent per year. The recent traffic shed area growth rate is more than twice that used in any past or on-going transportation studies and shows no signs of slowing. The traffic shed area has accounted for 43 percent of all residential units built over those years. To create a responsive multi-modal transportation impact fee program, there was a need to update the rates of expected growth and re-evaluate the capability of the City and TPO's transportation plans to accommodate the associated traffic growth.

For this plan update and fee study, a county-wide population that is the average of BEBR's midrange and high-range countywide forecast was used. A slowing rate of growth and a declining share of housing "capture" in the traffic shed area was also assumed to arrive at a 2045 Haines City subarea and Traffic-Shed population

Table 3-1 Population Forecast for SAP Plan Update

Year	Haines City Subarea	Traffic Shed Subarea	Haines City + Traffic- Shed	Rest of Polk County	County- wide Total
2024	32,007	107,637	139,644	660,149	799,792
2030	56,664	146,753	203,417	725,882	929,299
2035	77,190	165,324	242,514	768,808	1,011,322
2040	97,685	184,025	281,710	800,960	1,082,670
2045	118,113	202,895	321,008	822,338	1,143,346
Annual Growth Rate:	6.41%	3.06%	4.04%	1.05%	1.72%

1.05% Annual Growth Rate: 6.41% 3.06% 4.04%

estimates of 118,113 and 202,895 vehicles, respectively. At an average rate of 2.24 vehicles per household, a total of 143,307 homes are expected. This estimate is computed and illustrated in Table 2-1. The TPO growth forecast for the remainder of Polk County was retained.

For the 21-year (2024 to 2045) planning horizon, annual growth in travel on non-State surface roadways in the Haines City subarea is estimated to average 48,157 vehicle-miles per year. To keep pace with this growth rate, the City would need to add the equivalent of 7.2 lane-miles of roadway per year at an annual cost of approximately \$34.7 million. The TPO's 2045 Transportation Plan proposes to fund capacity on these roads at a rate of 10,213 vehicle-miles per year. To develop a collector road network that is typical of Lakeland and Kissimmee (two

nearby communities selected by City staff as "comparable") Haines City needs to build 76,570 vehicle-miles of capacity per year.

4. 2045 CityView Special Area Plan Transportation Plan Update

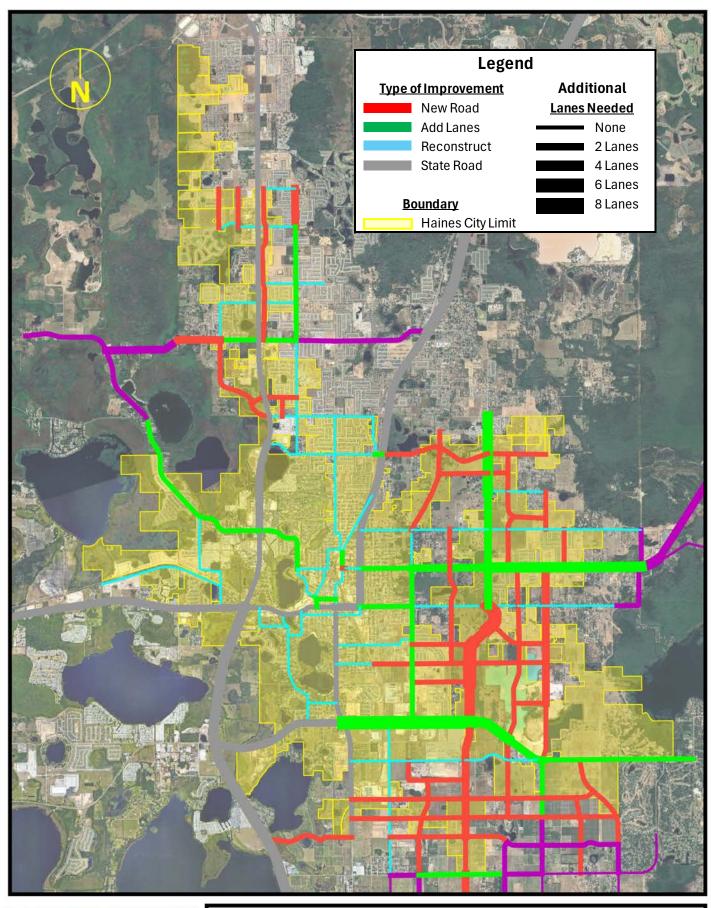

To address the transportation needs of growth, in 2021 Haines City developed a 2040 "Selected Area Plan" (SAP) Transportation Plan, a part of what is known as the "CityView" Plan, which serves as Haines City's Comprehensive Plan. In light of the more aggressive recent growth rates, this plan was updated to a 2045 horizon as a part of this study. The updated plan is illustrated in Figure 4-1, which illustrates the needed additional roadway lanes, and is more fully documented in a document provided in Appendix A. The updated Plan proposes the addition of 198.1 lane-miles of new County and City roadways with walking and bicycling facilities, over the 21-year horizon of the Plan, or at a rate of 9.4 lane-miles per year. It also proposes the re-construction of 34.6 lane-miles of existing roads (1.6 miles per year) of existing roads to add walking and bicycling facilities and features (medians, closed drainage, street lighting) to support suburban travel demands.

This plan is viewed as an "aspirational" plan at this time, as the revenues estimated in this study do not completely fund the plan. The Plan is estimated to cost over \$1.1 billion, or \$53.5 million per year. This shortfall is discussed further later in this report. The Plan does identify the County and City facilities estimated to serve circulation needs at the level of service standards adopted in the City's Comprehensive Plan. The City would select from the identified facilities to develop and fund transportation improvements. The travel demands of this plan are based on a "best guess" estimate of <a href="https://www.where.gov/where.g

5. Impact Fee Guiding Principles

Several legal requirements and principles guiding the development of a multi-modal transportation impact fee are either directly identified, or are implied, through case law or in State law that govern the development and assessment of impact fees.

Early legal challenges to impact fees developed the principles embodied in the "dual rational nexus" test. That is:

W.E. OLIVER, P.E., LLC

C:\WEO-PE\Projects\148.01-Haines City Mob Fee\3.
Analysis\SAP Plan\SAP Plan\qqz 08/06/2024

Figure 4-1 Updated SAP/CityView Transportation Plan

- the fees assessed must be in proportion to the needs created by the development, and
- fees collected must be applied to render a benefit to the payer.

Haines City's proposed multi-modal transportation impact fee satisfies the first condition by basing the fee on the quantity of transportation system capacity consumed by the development and recognizing credits for transportation revenues generated by the development.

The second condition is addressed by establishing districts within which the fees collected must be expended. The City's current impact fee ordinance requires that fees collected in the City must be expended within that district. However, a concept common in many impact fee programs recognizes that travel generated within any district, to some extent, extends into adjacent districts. Some communities allow a degree of flexibility to allow some of the funds collected in one district to be expended in adjacent districts, provided the expenditures benefit the travel from the originating district. This flexibility is attractive when fees collected are relatively low, enabling collected fees to be spent and the benefits of improvements to be realized more quickly.

Further, because of the small size of Haines City (compared, say, to Polk County), travel that is generated by land uses within the City often goes outside of the City and uses County or State transportation facilities both within and outside the City. Thus, provision may be made for the expenditure of some of the collected fees on roads under County jurisdiction and outside of the City limits, in proportions supported by the fee calculations. Expenditure on State facilities would not be supported, as travel on State facilities is deducted from the travel demand estimates.

F.S. 163.3180 generally requires that a development cannot be required to cure pre-existing deficiencies. This is achieved in Haines City's impact fee by establishing fees at <u>rates</u> that do not exceed the quantity of capacity consumed by the development paying the fee, recognizing fee credits, and charging at a rate that does not <u>improve</u> quality of service beyond the quality that past growth also funds for itself. Use of the funds to improve currently deficient facilities is acceptable, as the improvement would benefit the payer since the payers would likely use the improved facility.

F.S. 163.3180 also requires that fees be expended in accordance with a local government's adopted plan. An adopted Local Government Comprehensive Plan Transportation Element or Metropolitan Planning Organization's (in this case Polk County TPO's) transportation plan can serve this purpose. This study has relied on the City's adopted CityView SAP Plan within the City, and the TPO's Long Range Transportation Plan for areas outside of the City.

F.S. 163.31801 requires that fees be based on most recent and local data. This fee update study considers data from regional transportation planning programs, a local transportation plan update completed in 2024, and actual recent construction costs encountered in the region. The most currently available information regarding interest rates, fleet fuel efficiency, and other fee parameters were compiled, as discussed in subsequent sections of this report. Travel demand characteristics (trip generation rates, trip lengths, and percent new trips) for various land uses were compiled from the latest Institute of Transportation Engineers' <u>Trip Generation</u> (11th Edition) reference and from nearby studies, as these parameters were expected to be similar in Haines City.

The Florida Legislature amended F.S. 163.31801 provides for fee increases of <u>more</u> than 50 percent (as is proposed for Haines City) for situations where:

- an updated study has been undertaken which demonstrates the need for a greater increase,
- that the extraordinary circumstances that justify the fee increases be discussed in two separate Board of City Commissioners workshop sessions, and
- the fee increases are adopted by a two-thirds majority of the City Commissioners.

Finally, F.S. 163.31801 requires a 90-day or more advance notice when fees are being increased.

Case law (Ormond Beach vs Volusia County, 1989) has also established that development within municipalities is not exempt from participating in County transportation system funding programs. Should the Counties insist, the County fees must be collected by the municipalities and remitted to the Counties, or the City should apply the County share of fees in ways approved by the County through interlocal agreement.

This study has demonstrated the need for increased revenues for transportation, as the revenues estimated from County sources fund only 25.4 percent of the City's estimated needs. The City's Comprehensive Plan policies mandate the funding of the City's adopted plan.

The City's Comprehensive Plan Capital Improvements Element includes the following statements:

- "1.(b) The element ... shall address:
 - 4. the extent to which future development will bear a proportionate cost of facility improvements necessitated by the development in order to adequately maintain adopted levels of service, and

- (b) the demonstration of the local government's ability to finance the needed improvements identified in the individual comprehensive plan elements and to manage the land development process so that public facility needs created by previously issued development orders or future development do not exceed the ability of the local government to fund and provide the needed capital improvements.
- (c) The element shall contain one or more policies for each objective which...
- 8. assessing new developments for a pro rata share of the cost necessary to finance public facility improvements necessitated by development in order to adequately maintain adopted levels of service"

Capital Improvements Cost Sharing.

Objective 7.1.4. – Proportionate Fair Share. The City shall ensure that all future development pays its share of cost associated with demands for existing and future facility needs

Policy 7.1.4.2. – Pro Rata Share for Financing Public Facility Improvements. The City shall require new developments a pro rata share of expenses necessary to finance public facility improvements created by development in order to maintain adopted levels of service standards.

Policy 7.1.4.4. — Application of Proportionate Fair Share Concurrency Methodology. The City shall apply its adopted proportionate fair share concurrency methodology to ensure that future development pays its share of cost associated with demands for existing and future facility needs. The City shall isolate program costs and implement user fees where practical. The City shall continue to apply its established cost sharing formula and use impact fees or other development exactions to finance improvements which are required to service future growth.

Implementation.

Policy 7.1.7.2. – Collection of Impact Fees. The City shall continue to collect impact fees for the purpose of off-setting the cost of public facility improvements.

Policy 7.1.7.6. – Direct or Indirect Impact on the Level of Services. All new development which has a direct or indirect impact on the level of services established in the several elements of the City comprehensive Plan shall continue to be subject to impact fees which shall be spent to directly benefit those from whom they were collected.

Policy 7.1.7.7. — Bi-Annual Evaluation of Impact Fees. The City shall bi-annually evaluate current impact fee schedules and consider requiring additional impact fee classifications and fee schedules to pay for all new public facilities and services generated as a result of new development.

6. Multi-Modal Transportation Impact Fee Calculation

This section of the report discusses the general fee calculation strategy and the values of the various parameters to compute the fees.

In this study, State highways have been excluded, under the assumption that the City's Multi-Modal Transportation Impact Fee program will fund only City and County roadways. There are some roads in the CityView Plan that are either now County roads, or may ultimately become County roads. Thus, the fee calculations address all non-State roads. The Multi-Modal Transportation Impact Fee computed in this way must recognize that the fee addresses County as well as City needs and, from the computed fee, the County's adopted fee would be remitted to the County.

The fee is computed in consideration of three components to recognize the proportion of travel occurring in the three geographic areas illustrated in Figure 2-1 – travel within and immediately adjacent to the City limits (the "Haines City Subarea"), travel within the remainder of the US 27 "traffic-shed" subarea, and travel throughout the rest of Polk County. These calculations recognize the differing quality of service goals for these areas through the use of a parameter called the capacity addition ratio – a number that relates the quantity of capacity to be built per unit of growth in travel.

Haines City's historical fee schedule included 25 land use categories. Three land uses, "Racquet Club", "Bowling Alley", and "Movie Theater" were eliminated from the fee schedule. Replacing "Racquet Club" is the newer ITE category "Fitness Center". No strong data was available to support fee rates for the Bowling Alley and Movie Theater land uses, so these uses were deleted from the fee schedule. Single-family residential uses were stratified into three size ranges to reflect differences in travel generation. The size ranges are: Less than 1,500 s.f., 1,500 to 2,499 s.f., and 2,500 s.f. or larger. In addition, a category for "Fine Dining" was added to the Restaurant land use category.

The general impact fee equation is:

Fee = Capacity Needed x Cost of Capacity - Credits

Capacity Needed Variables

The capacity needed is the product of vehicle-trip rate x trip length x percent new trips x capacity addition ratio / 2. This calculation yields the quantity of transportation system capacity that is needed to address the capacity consumed by a development in units of vehicle-miles of capacity.

The trip rate indicates the number of vehicle-trips generated on a daily basis, the trip length is the average length of vehicle-trips to and from the site, and the percent new trips is the proportion of trips that represent additional, new travel that is generated by the land use. Some retail land uses (e.g. a convenience store, fast food, or gasoline station) "capture" traffic from the adjacent street. The "captured" trips are those which avail themselves of the convenience use while they are en-route to their intended destination and do not add additional travel to the system. The percent new trips factor adjusts the computation to acknowledge this characteristic.

Trip generation rate and percent new trips information was compiled from the Institute of Transportation Engineers' (ITE) <u>Trip Generation 11th Edition</u> (2022) reference. This data, and trip length data, was then compared to similar data from fee schedules of nearby communities (Orange, Osceola, Polk, and Hillsborough Counties, and the City of Lakeland) to ensure consistency and reasonableness. A summary of this compilation and comparison is provided in Appendix B.

Trip length data is based on a variety of sources, including the National Household Travel Survey, urban transportation systems planning models maintained by the local Metropolitan Planning Organizations (Polk TPO), and field studies of the trip lengths of various land uses.

The capacity addition ratio deserves some discussion. The ratio is a policy-driven number that sets a community on a "trajectory" to achieve a desired quality of service. The quality of service provided by a road network can be roughly measured on an area-wide basis by comparing the quantity of travel (vehicle-miles of travel, or vmt) with the quantity of capacity available in the network to serve that travel (vehicle-miles of capacity, or vmc). The higher the ratio of travel to capacity (vmt:vmc ratio), the greater the congestion. While this ratio is a very simplistic measure (it assumes all roads operate at the same degree of "fullness"), the inverse of this ratio establishes needed funding levels and therefore fee rates needed to achieve a desired future quality of service.

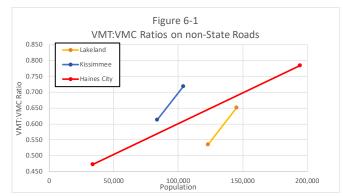

A policy issue is for a community to select a desired future quality of service goal, or vmt:vmc ratio, for their transportation system. Comparing local conditions with those of other communities is helpful in that regard. This is effectively setting a level of service standard as is commonly done in the transportation element of a local government comprehensive plan. Many communities adopt a policy statement that says "No road shall operate at a peak hour level of service worse than E". Not every road in a network can operate at exactly the upper limit of the level of service E condition -- some roads will operate at levels of service A, B, C, or D, as well. To avoid any single road from operating at a condition worse than E, an average condition that is somewhat better than E must be maintained – a condition where the vmt:vmc

ratio is less than 1.0. To maintain this quality of service ratio as travel grows, capacity must be added at its inverse rate – a rate greater than 1.0.

The City and County roads the City is seeking to fund are different from arterial roads. Local collectors are not major "through-routes" and are not as heavily utilized as arterials. They are frequently two-lane roads because a community cannot build less than two lanes, and the traffic demands rarely, if ever, create the need for more than two lanes. Thus, excess capacity must be built to meet the land access function these local collector roads serve. Some of the non-State roads, such as Powerline Road, will serve heavier traffic volumes and would become candidates for assignment of jurisdiction to the County, or even the Florida DOT.

To gain an appreciation for a desirable level of service and appropriate capacity addition ratio

for Haines City, City staff asked to consider the quality of service (vmt:vmc ratios) existing in Lakeland and in Kissimmee. Figure 6-1 illustrates the vmt:vmc ratios for the central Lakeland area and for Kissimmee for 2015 (model validation year) and 2045 (plan horizon) for non-State roadways vs their populations. The geographic areas evaluated and more

details regarding these numbers are provided in Appendix C.

The data in Appendix C indicate that the "local" networks operate at levels of congestion lower/better than the State facilities, and are in the range of 0.54 to 0.61 in 2015, progressing to 0.65 and 0.72 by 2045. These four measures average out to a value of 0.63. If Haines City wishes for its "local" road system to operate at an average vmt:vmc ratio of 0.63, then capacity needs to be added at a rate of (1/0.63=) 1.59 times the rate of growth. If, at the same population levels, Haines City wishes for its vmt:vmc ratios to be similar to those experienced by Lakeland and Kissimmee at their respective populations, then a capacity addition ratio of 1.10, plotted in Figure 6-1 will allow the City's vmt:vmc ratio to transition from 0.47 at its 2023 estimated population of 33,660 to 0.79 at its 2045 population of 194,629. Since neither comparative City is currently experiencing a vmt:vmc ratio of 0.79, the lower vmt:vmc ratio of 0.63 has been selected as the goal vmt:vmc ratio, with an associated capacity addition ratio of 1.59 for initial fee schedules.

Two alternative fee calculation strategies were undertaken with regard to the traffic-shed area. The first strategy was to respect the County's capacity addition ratio, estimated at 0.25, to both the "Shed" area and the remainder of Polk County, while pursuing a capacity addition ratio of

1.59 within the Haines City subarea. In the second strategy, the participation of Polk County and the adjacent cities of Davenport, Dundee, and Lake Hamilton would be solicited to implement and fund a uniform quality of service standard that provides capacity to serve development at a good level of service throughout the traffic-shed area. In this alternative, the same capacity addition ratio (e.g. 1.59) would be applied to the City and to the traffic shed area. The second alternative assumes the capacity addition ratio that is proposed for Haines City's fee (e.g. 1.59, rather than 0.25) would be applied in the traffic shed area.

An example calculation to illustrate how the capacity addition ratio is applied, and its effects on the two alternative scenarios, follows for a development with an average trip length of eight miles. If 35 percent of the trip length is on State highways, Interstate highways or toll roads, another 25 percent is on non-State roads in the traffic-shed area outside the City, ten percent is on non-State roads throughout the rest of Polk County, and the remaining 30 percent is on local roads within the Haines City subarea, then the quantity of capacity to be replaced is computed as:

First scenario capacity to be built = 8 vehicle-miles * $(35\% \times 0.0 + 25\% \times 0.25 + 10\% \times 0.25 + 30\% \times 1.59/2)$

- =8 vehicle-miles x 0.2822
- =2.25 vehicle-miles

Where:

- 0.0 is the capacity addition ratio for State, Interstate, and toll roads (e.g. thus excluding them from fee),
- 0.25 is capacity addition ratio for other non-State roads outside of the Haines City subarea.
- 1.59 is the capacity the addition ratio for major collector and arterial roads within the Haines City subarea only,

For the second scenario, the capacity to be built = 8 vehicle-miles * $(35\% \times 0.0 + 25\% \times 1.59 + 10\% \times 0.25 + 30\% \times 1.59/2)$

- =8 vehicle-miles x 0.4497
- =3.60 vehicle-miles

Where:

- 0.0 is the capacity addition ratio for State, Interstate, and toll roads (e.g. excluding them from fee),
- 0.25 is capacity addition ratio for other non-State roads outside of the Haines City and Shed subareas,
- 1.59 is the capacity the addition ratio for local major collector and arterial roads within the Haines City <u>and Shed</u> subareas.

Choosing a policy for better quality of service in the larger Shed subarea establishes a need to construct more capacity per unit of growth, thus leading to a greater revenue need and larger fees. The effects of these strategies is further discussed in the following Chapter.

This factor should not exceed the quality of service funded by the existing population to prevent setting fee rates that improve quality of service (e.g. avoids new growth funding prior deficiencies). A lesser factor is acceptable. In the preliminary fee schedules, a factor of 1.59 reflects a quality of service goal (or vmt:vmc ratio) of 0.63, which indicates more congestion than the 0.47 vmt:vmc ratio estimated for current (2023) conditions – thus not funding improvement of quality of service.

Finally, the factor of two in the denominator recognizes that the demand for travel arises from the need to travel between two land uses, and allocates the responsibility for the travel equally between the two uses.

Interstate, Toll, and State Road Travel Estimates

Estimates of the extent to which travel generated by land uses in Haines City relies on toll roads, Interstate 4, and State highways, and the extent to which trips generated by development within the City make use of local streets, other roads in the "shed" area, and roads in other areas of Polk County was developed using information extracted from the seventh edition 2045 Central Florida Regional (Transportation) Planning Model (CFRPM7).

While the District One Regional (Transportation) Planning Model (D1RPM) is the official TPO model for transportation planning in Polk County, the CFRPM7 model was chosen for the Haines City area due to the area being located on the edge of the D1RPM, whereas it is located more centrally in the CFRPM7, and because of the heavy interaction of the Haines City area with Osceola, Orange, and Lake Counties – which are not included in the D1RPM. The CFRPM7 model also includes all of Polk County, thus accounting for many of the destinations of Haines City area trips. As a part of this model application, several large traffic analysis zones in the Haines City area were refined into smaller zones, and the socio-economic data of the CFRPM7 was adjusted to reflect the higher growth rates being experienced. Worksheets provided in Appendix D provide more information regarding the model adjustments and result summaries.

The proportion of travel generated in the Haines City Subarea that uses State roads, the toll or Interstate highway system was estimated by executing select-zone (all traffic analysis zones in the Haines City subarea) traffic assignment using the CFRPM7 model and highway network from Haines City's 2045 CityView SAP Transportation Plan, and tracking the quantity of this travel on these and non-State roads in the Haines City subarea, the traffic "shed" subarea, and other areas of Polk County. This analysis indicated that for an average trip length of 7.4 miles,

55.4 percent of travel with one end of their trip in the Haines City subarea makes use of Interstate 4, toll roads, and State highways, 23.4 percent stays within the Haines City subarea, 13.3 percent travels into or through the traffic shed area, and the remaining 7.9 percent travels into other areas of Polk County on non-State roads. These proportions were adjusted based on trip length – short trips stay "closer to home" and do not use the State, Interstate, or toll roads as extensively, whereas longer trips make more use of the State, Interstate, and toll roads to reach their destinations. The proportions used in the fee calculations, as a function of trip length, are provided in Appendix E. The fee schedule makes use of this information to appropriately weight the fees to reflect not only system usage, but also the different quality of service goals of each area.

Cost per Unit of Capacity

The cost of capacity is what it costs to deliver transportation system capacity, expressed as a cost per vehicle-mile of capacity. When the needed vehicle-miles of travel is multiplied by the cost per vehicle-mile of capacity, the result is the cost to provide the infrastructure capacity needed to serve the development at the desired quality of service.

Costs of roadway improvements in Polk County, City of Lakeland, Osceola County, and Orange County were compiled by other consultants recently undertaking similar fee studies. These tabulations were reviewed for applicability to Haines City. Using this central Florida information, City road construction costs were estimated at \$613.08 per vehicle-mile of capacity. This information, summarized in Appendix F, includes design, right-of-way, drainage, environmental mitigation, construction, and construction inspection cost elements, as well as sidewalk and bicycle facilities as part of the standard cross-section.

Revenue Credits

Credits are issued to land uses in recognition that their travel generates revenues that are used to provide capacity in the transportation system. For example, when a vehicle drives from or to a development it burns gasoline and some of the motor fuel taxes so-generated are used to construct transportation system capacity. Funds that Polk County and Haines City rely upon for expansion of the transportation system come from a portion of the County's motor fuel taxes and impact fees. Since this fee study seeks to address both City and County facilities, it is appropriate to consider the revenues that the County commits to funding transportation.

Table 22 of Polk County's <u>2023 Transportation Impact Fee Update</u> report indicates the County intends to spend \$199,692,561 on expanding the County transportation system capacity from 2023 to 2027 from non-transportation impact fee sources. This level of funding is a commitment of an equivalent 9.41 out of the allowed 15 pennies of motor fuel taxes per gallon for capital purposes. For purposes of Haines City's Multi-Modal Transportation Impact Fee, the

W.E. Oliver, P.E., LLC September 5, 2024 present value of this level of credit over a 25-year period assuming a fuel efficiency rate of 24.53 miles per gallon of gasoline was recognized as a revenue credit for each land use in the fee schedule. A worksheet summarizing the derivation of the 9.41 pennies per gallon value is provided in Appendix G.

The Federal government and State of Florida levy motor fuel taxes as well, and allocate a portion of them to expanding Federal and State highways. However, since the costs of travel on, and improvements to, the State highway system were <u>excluded</u> from this study, no Federal or State fuel tax credits were applied. Nonetheless, for purposes of computing the <u>County</u> motor fuel revenue credits, the Interstate, toll road, and State highway portions of the trip <u>length</u> and a 0.5-mile local trip length add-on are included, because County motor fuel tax revenues are generated without regard to which road system a vehicle is driven upon – on a toll road, on a state road, or on a local street. Thus, in this calculation, the equivalent gasoline tax is estimated assuming a longer trip length than used in the travel demand (cost) portion of the fee.

Should the City or County choose to develop additional revenues for transportation facilities, those sources should be considered in a future update to the fee program.

Interest Rate

The present value factor for the capacity-expanding revenue credits is based on 25 years at a 3.3% discount rate. The discount rate is based on FDOT's guidance on construction cost inflation for transportation planning purposes. A copy of this data source is provided in Appendix H.

Finance Period

A 25-year finance period is commonly used in transportation impact fee analyses, and represents the typically assumed life of transportation capital investments.

Equivalent Days/Year

To estimate revenue credits, 326.9 (= 365*6.27/7) days per year were used. 6.27 days per week is used to reflect that the amount of travel on Saturdays and Sundays is less than on a typical weekday. A worksheet summarizing the value calculated is also provided in Appendix H.

Fuel Efficiency

24.53 miles per gallon (mpg) for light-duty vehicles and motorcycles was estimated from 2024 FHWA Table VM-1, provided in Appendix H.

7. Example Fee Calculation

An example fee calculation is provided in this section for a 1,500 to 2,499 s.f. single-family detached home. The general fee equation, is as presented previously but this example incorporates the fee as affected by the geographic subarea considerations.

Fee = (Capacity Needed x Cost of Capacity – Credits) x Discount Percentage

Each component of the calculation is described below. Note that the calculations here use rounded values and results are slightly different from the "un-rounded" actual fee schedule calculations of Appendices H and I, which apply additional decimals.

Capacity Needed is the capacity needed to respond to the quantity of new travel generated by the land use that makes use of the transportation system for which the fee is calculated. It is the product of trips generated, the length of trips on the non-State road system, the percentage of trips that are added (as opposed to captured from traffic already passing by the site). This quantity is divided by two to reflect division of the demand arising between the two land uses at the origin and destination ends of the trip. This quantity is further reduced in Haines City's fee to deduct the portion of travel that makes use of State and toll roads.

For the single-family home, this calculation is:

Trip rate x Trip length x Percent new trips x (1-State, Interstate, and toll proportion) / 2 = $9.43 \times 6.62 \times 100\% \times (1-0.483) / 2 = 16.14$ vehicle-miles of travel (16.15 in un-rounded calculation)

The weighted unit cost per vehicle-mile of capacity applied to a land use depends upon the fee district in which the land use is located, the proportion of travel the land use sends to each subarea (which is a function of trip length – shorter trips have higher proportions of travel in the geographically closer subareas and less travel on State roads, Interstate 4, and toll roads), and the quality of service to be delivered in each district as expressed by the capacity addition ratio (CAR), as follows:

```
(% travel in Haines subarea x Haines unit cost x Haines CAR + % travel in Shed subarea x Shed unit cost x Shed CAR + % travel in other Polk County subarea x other Polk County unit cost x other Polk County CAR) x weighted CAR factor = (0.590 \text{ x } $613.08 \text{ x } 1.587 + 0.249 \text{ x } $458.00 \text{ x } 0.246 + 0.161 \text{ x } $458.00 \text{ x } 0.246) \text{ x} (16.15/16.75)
```

W.E. Oliver, P.E., LLC

September 5, 2024

=\$598.00

The weighted CAR factor is the ratio of assessable travel generated to capacity needed, applied to avoid double-counting the CAR in the computation (once in the calculation of needed capacity and again in the computation of weighted average cost per vmc).

Total Impact Cost is:

Assessable vehicle-miles of travel x weighted unit cost $16.75 \times $598.00 = $10,016.50 ($10,015 in un-rounded calculation)$

The credit is calculated as:

Present value of (Trip rate x Trip length for revenue x Percent new trips x equivalent days per year x number of equivalent dollars of gas tax/ (vehicle miles per gallon x 2), at 3.3% APR for 25 years.

```
=[(9.43 x 7.12 x 100% x 326.9 x 0.0941/ (24.53 x 2)] x 16.8451
= $709.16
```

Thus, the resulting gross potential fee is:

\$10,016.50 - \$709.16 = \$9,307.34 (\$9,306 in un-rounded calculations)

Recognizing that development that is already in Haines City (e.g. prior growth) also generates gasoline tax revenues that fund infrastructure needs allows the City to not assess the full potential fee amount. It is common in communities to recognize these additional revenues and to provide an "across-the-board" reduction in the fees charged. The extent to which fees can be reduced depends on the capability of revenues generated by prior growth to address needs and are related to community goals for transportation services and quality of service. Haines City's goals and overall transportation infrastructure funding capability is addressed in the next section of this report.

8. Fee Schedules for Consideration

The magnitude of an impact fee should be considered in the context of community goals and other sources of revenue that are available for transportation purposes. Two different fee schedules were generated for consideration by the City Commission. Since State statutes require an impact fee to be updated no less frequently than every five years, the fee schedules discussion herein address a five-year planning horizon. In the below discussions, the fee for a 2,000 s.f. home is used as a "reference" fee to allow for comparisons – fee rates for other land uses and other quantities of growth are "in proportion" thereto and are applied in the calculations to arrive at revenue estimates.

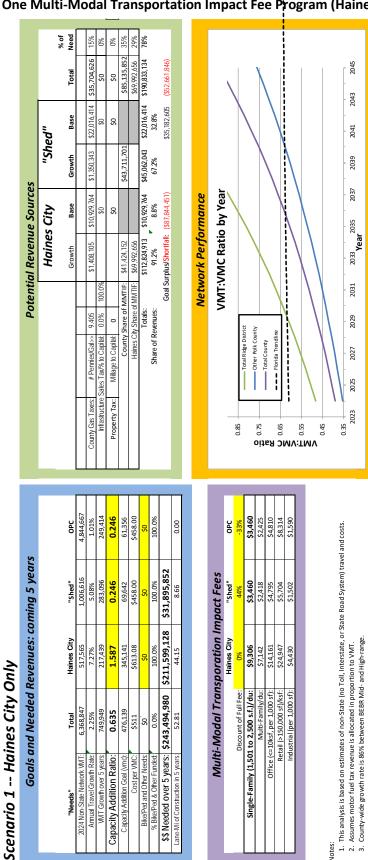

The first scenario fee schedule would be imposed on new development within the City only. The remainder of the County and adjacent municipalities have their own, but different, quality of service goals and transportation impact fees. The first fee schedule uses a proactive quality of service goal of maintaining an average network vmt:vmc ratio of 0.63. The City's fee covers the County's transportation impact fee, and from its collections the City would remit to the County the level of fee indicated in the County's fee schedule. Development outside of the City would participate in the County fee and any additional applicable municipal fee. The "performance" of this fee schedule is summarized in Figure 8-1 for the Haines City and Shed subareas.

Under the first fee scenario, the quantity of travel growth on non-State roads in the Haines City subarea is estimated to be 217,439. With a capacity addition ratio goal of 1.587 a goal of adding 345,141 vehicle-miles of capacity costing \$211.6 million over the coming five years is estimated. A fee rate of \$9,306 for a 2,000 s.f. home yields a five-year revenue forecast of \$123.8 million (including County impact fees and motor fuel taxes committed to capital) over the same period – funding only 58.5 percent of the capacity addition needs, falling short of the quality of service preservation goal of 1.587. Further, none of the road <u>reconstruction</u> needs proposed in the CityView/SAP Plan would be funded.

This result highlights a disadvantage of this geographically limited fee funding strategy – not all the travel on non-State roads in the Haines City subarea is generated by Haines City development. The irregular nature of the City limits is such that the roads funded by the City will also serve substantial quantities of travel generated by development outside of the City. Estimates of the CFRPM7 model are that only 68.2 percent of the travel on non-State roads within the Haines City subarea is generated within Haines City. Since, in this first scenario, the fees for development within the City are substantially greater than the fees charged to development outside the City limits, a greater burden is placed on City development to fund transportation than is placed on development outside the City Limits. This analysis points out

W.E. Oliver, P.E., LLC September 5, 2024

Figure 8-1: Scenario One Multi-Modal Transportation Impact Fee Program (Haines City Only)

W.E. Oliver, P.E., LLC September 5, 2024

Haines City, Florida

the need to encourage the jurisdictions surrounding Haines City to also pursue a more substantial transportation revenue program.

A second fee scenario was developed which made the assumption that the entire Shed subarea participates in providing the better roadway quality of service – adopting the same 1.587 capacity addition ratio, and recognizing the likely greater cost to implement the facilities than assumed in Polk County's Transportation Impact Fee (\$613.08 rather than \$458.00 per vehicle-mile of capacity). This change would increase the fee for the 2,000 s.f. single-family home to \$12,772 because the portion of City-generated travel which goes outside the City limits (e.g. in the Shed subarea) would now be assessed at the higher quality of service goal. The "performance" of this second fee schedule is summarized in Figure 8-2 for the Haines City and Shed subareas.

The quantity of growth expected in the total of the two subareas (Haines City plus Shed) is 500,535 vehicle-miles of travel but, with the higher quality of service goal, the desired quantity of capacity is 794,500 vehicle-miles of capacity. In this scenario, the fee for the single-family home is \$12,772 in Haines City (\$12,678 in the Shed subarea), five-year revenues generated are \$351.8 million, funding 573,796 vehicle-miles of capacity or 72.2 percent of the capacity addition goal. This revenue program provides a capacity addition ratio of 1.146, meeting the growth at a 1.00 (not 1.587) capacity addition ratio, and providing a 14.6 percent margin of capacity adequate to maintain a good level of service for the entire Shed subarea non-State road system. (It is difficult to achieve the goal capacity addition ratio of 1.597 because the development in the subareas does not account for all the travel in the road network.)

In regard to the Haines City subarea, the second scenario revenue generated by this broader quality of service goal is estimated at \$158.54 million, which would fund 75.6 percent of the City's capacity addition goal.

Consistent with Comprehensive Plan policies, the City Commissioners elected to adopt the first scenario fee schedule, which maximizes City revenue generation while respecting the quality of service goals applicable to development outside of the City's jurisdiction. The resulting revenue program falls short of the funding levels needed as indicated in the CityView SAP Plan; however, the fee represents a significant increase in the share of mobility that will be funded by new development and puts the City in a better position to respond to growth as the City continues to seek strategies to provide the infrastructure needed to support the growth that is occurring. A scenario one fee schedule summary is provided in Table 8-1, and fee schedules with intermediate calculations are provided in Appendix I.

Notes: 1. Where more than one land use code is listed, the rate is an average of the land uses.

^{2.} After fourth County adjustment in June, 2026.

^{3.} County charges on a "per 1,000 s.f." basis, whereas City fee is by number of fueling positions.

It is always of interest for communities to be aware of how their fees compare to the fees of nearby communities. Table 8-2 provides such a summary of the current fees levied by nearby communities. Where the fees include a component for the State road system, that is noted in the table.

Table 8-2: Transportation Impact Fees of Nearby Communities

^{3.} Asterisk denotes inclusion of State roads in fee.

9. Conclusion

Analysis of transportation and development growth trends in Haines City illustrate that travel demands are growing at a faster pace than funding to expand system capacity. Annual revenues of \$42.3 million are required to add capacity to maintain the desired quality of service on the non-State roadway system at the rate that travel is increasing. This fee study proposes a multi-modal transportation impact fee increase that, in combination with other revenues, generates \$31.7 million per year, compared to the current revenue program which generates an estimated \$14.0 million per year.

This study presented two fee rate scenarios for consideration by Haines City. The first scenario proposes the City adopt, within the City, proactive quality of service goals that are better than the current combined County and City transportation impact fees provide, while respecting the current quality of service goals that are funded by the surrounding jurisdictions. This fee schedule roughly doubles the current fees. However, this scenario does not address all the needs within the City because City development does not generate all traffic growth within the City.

The second scenario fee schedule expands the geographic area for which the better, City quality of service goal to include the "Shed" subarea surrounding the City that also relies on the same road system as Haines City. In this scenario the fees are higher, and the quality of service delivered is better. However, the second fee scenario assesses development outside the City for travel at a better quality of service than those areas have adopted, and thus the second fee schedule is not recommended at this time. For the benefit of all, the participation of Polk County and the cities of Davenport, Dundee, and Lake Hamilton in similar revenue programs with similar quality of service goals should be encouraged and pursued.

The City would use the funds collected from the fee to implement improvements identified in the CityView/SAP plan with priorities indicated by advancement of selected improvement into the City's Capital Improvement Program.

In consideration of 163.31801 Florida Statutes requirements regarding adoption of fee increases of more than 50 percent, the City must find its circumstances are extraordinary in two public workshops. The City's circumstances are extraordinary because this multi-modal transportation impact fee will replace a legacy transportation impact fee which:

- is based on a technical support analysis that has not been updated since 2004 and is not based on the City's currently adopted transportation plan,
- does not reflect recent extraordinary growth trends,

- does not recognize that improvement costs have increased beyond the indexing rate of the legacy fee,
- does not recognize that roadway congestion levels in and around the City exceed those found in other areas of Polk County, and
- does not make use of the latest, localized plans and data,

Following the workshops, the City may adopt the fee, to go into effect with a 90-day advance public notice.

Re: Haines City Mobility Fee Study -

CityView Select Area Plan (SAP) Transportation

Element Update

Introduction

Haines City has been growing at near unprecedented levels in recent years, resulting in rapid increases to volume of traffic, level of congestion, and the associated negative impacts on public safety, mobility, and the quality of life in the community. To manage transportation within the City, multiple plans and reports have been prepared over the years to aid in mitigating the effects of the substantial area growth. Transportation network visions and policies for implementation were initially adopted in the City's CityView Selected Area Plans (SAP's) and Comprehensive Plan Amendment 10-2 in 2008. Revisions to the SAP were adopted in 2010, and an additional Transportation Element Update to the SAP was submitted in 2022.

This memorandum has been developed as a 2024 addendum to the SAP. The following sections of this memorandum will define the expected future conditions of the City, report on alterations to the model network based on projected growth, and develop cost estimates for upgrades to the roadway infrastructure identified in the 2022 SAP report. This future conditions evaluation, supported by a travel demand modeling effort and an analysis of future roadway level of service, was undertaken in support of a Haines City Mobility Fee update study.

Future Conditions Analysis

Socioeconomic Data and Traffic Analysis Zone Refinement

To create a mobility fee program responsive to recent growth trends, it was necessary to update the growth forecasts and re-evaluate the capability of the City and TPO's transportation plans to accommodate the associated travel demands.

The University of Florida's Bureau of Economic and Business Research (BEBR) 2023 population forecasts for Polk County indicate total growth from 770,019 in 2022 to 1,033,800 by 2045, an overall growth rate of 1.29% per year. A faster growth rate of 2.28% per year is forecast from 2022 to 2030, which then slows to a rate of 0.79% per year from 2040 through 2045.

In its on-going transportation planning work, the Polk County Transportation Planning Organization (TPO) allocates this growth to traffic analysis zones (TAZ's), which are smaller geographic subareas, throughout the County. The TPO has assigned a growth rate of 2.95% per year for a "traffic-shed" area around Haines City, adding 5,999 persons per year from 2024 through 2045, resulting in a population forecast of 257,220. However, a traffic-shed area larger than Haines City was considered as

18 July 2024 Page 2

the larger area sends travel into and through Haines City. The traffic shed area is illustrated in a map in Attachment A.

Haines City's 2022 CityView SAP was based on a traffic-shed year 2040 population forecast of 234,712. This population growth rate from 2024 to 2040 is 3.18% per year, adding 6,194 persons per year.

Based on Polk County property tax records, recent housing growth rates in the traffic-shed area are substantially greater than those of the TPO and the City's 2022 CityView SAP Update and show no signs of slowing. The traffic-shed area has accounted for 43 of all residential units built in Polk County from 2019 to 2023, adding 3,846 dwelling units per year, able to house an annual population increase of 8,615 persons⁽¹⁾.

For this update, an average county-wide population using BEBR's mid-range and high-range countywide forecast was used. Based on the property tax data, advice of City staff, and the BEBR population forecast, a traffic-shed growth rate of 4.04% per year was used for this update, adding an average of 8,636 persons per year, arriving at a traffic-shed population estimate of 321,008. The Haines City sub-area population was estimated at 118,1132. Population and employment estimates for the remainder of Polk County as developed by the TPO were preserved. The population forecasts can be reviewed in Table 1.

Many of the TAZ's in the eastern portions of Haines City were large, as no substantial growth had been forecast for these areas. However, with the larger growth forecast and more extensive anticipated road network, it was necessary to refine the zonal structure. In an area where the "out of the box" model included 116 TAZ's, the zones were sub-divided into 199 TAZ's. Attachment A includes a map illustrating the refined TAZ structure and a zone-by-zone tabulation of the 2045 socio- economic data that was used for this update.

Table 1: SAP Plan Population Forecast Summary

Year	Haines City Subarea	Traffic Shed Subarea	Haines City + Traffic-Shed	Rest of Polk County	County-wide Total
2024	32,007	107,637	139,644	660,149	799,792
2030	56,664	146,753	203,417	725,882	929,299
2035	77,190	165,324	242,514	768,808	1,011,322
2040	97,685	184,025	281,710	800,960	1,082,670
2045	118,113	202,895	321,008	822,338	1,143,346

Travel Demand Modeling and Network Refinement

6.41%

Annual Rate:

The travel demand modeling effort used the Florida Department of Transportation (FDOT) Central Florida Regional Planning Model 7 (CFRPM). The CFRPM 7 was chosen over the District 1 Regional Planning Model (D1RPM) used by the TPO because Haines City is more centrally located within the CFRPM, and area travel demands are oriented more toward CFRPM counties than the Southwest Florida

4.04%

3.06%

1.05%

1.72%

¹ At a persons per household average of 2.24.

Page 3

counties included in the D1RPM. (The D1RPM extends from Polk County on the northeast to Collier County on the southwest, whereas the CFRPM includes Polk, Osceola, Orange, Lake, and other counties to the northeast.) Selection of the model was conducted in coordination with City staff and validation was assumed to be included in the latest model. The results of the network refinement for this project are illustrated in Figure 1, with supporting data provided in Attachment B. The 2045 SAP Plan road network is composed of 131.8 miles of major roads in and adjacent to Haines City. Of that, 25.8 miles are State roads, and the remaining 106.0 miles are Polk County or City roads. Of the 106 miles of County and City roads, 45.3 miles are new roads.

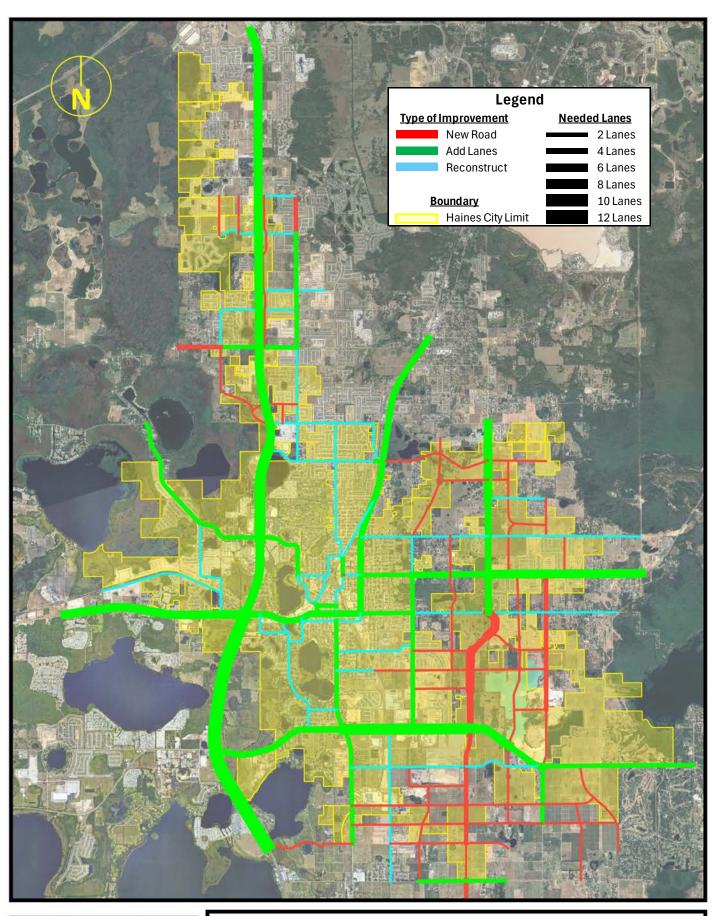

Level of Service Analysis

The results produced by the CFRPM provided a basis for determining the anticipated level of service for the framework facilities. The results were then developed using the FDOT 2023 Multimodal Quality/Level of Service Handbook Generalized Service Volume Tables based on an adopted LOS "D" for roadways in urbanized areas. The 2023 Handbook uses the newly adopted Context Classification rather than lane and speed limits, and the Preliminary Context Classification Transportation Data and Analytics (TDA) site was referenced for roadways with identified Context Classification; otherwise, engineering judgement was applied to roadways that did not have Context Classifications identified within the TDA.

Improvements are summarized in three categories in this review: Construction of new roads, adding lanes to existing roads, and reconstruction of existing roads.

- The plan proposes to add 108.9 lane-miles on 45.5 miles of new roadways to provide access to undeveloped land and congestion relief by creating new, alternative routes for travel.
- Addition of 89.2 lane-miles to 25.3 miles of existing City/County roads is indicated as needed to maintain the City/County adopted level of service standard of "E".
- A proposal to reconstruct virtually all existing City and County roads was also advanced in the 2022 CityView SAP. The intent of the reconstruction was to provide for urban amenities on roads within the City (e.g. pedestrian and bicycle facilities, street lighting, medians, on-street parking, closed drainage systems, etc.) at a considerable cost. Many of these roads were constructed to serve rural travel, but as the City has grown, the need to provide for urban and suburban travel demands has emerged.

Some lane addition and costs have been identified on State roads as well; however, in some cases the number of lanes needed to maintain adopted level of service standards exceed State policies on maximum number of lanes on State highways. The Florida DOT is in the process of studying alternative strategies to reduce travel demands and congestion on US 27, to which no solution has been formally adopted into local government transportation plans. Figure 1 illustrates the Plan, and Tables 2 and 3 summarize some of the features of the Plan. The LOS analysis and network inventory data is provided in Attachment B.

Cost Estimates

Costs were estimated for the roadway facility improvements identified in the updated SAP Plan. Unit costs (cost per mile) were developed for each segment using FDOT's Cost Per Mile Models for Long Range Estimating based on year 2022. The costs were then adjusted using a standard inflation rate for year 2024. The estimated unit costs are noted in Table 4.

Table 4 Estimated Unit Costs

ROADWAY TYPE	CONSTRUCTION	RECONSTRUCTION
1 Boulevard Residential - Rural 2-Lane	\$5,071,500.00	
2.1 Boulevard Residential - Rural 2-Lane Transitional	\$6,313,500.00	
2.2 Boulevard Residential - Urban 4-Lane	\$15,111,000.00	\$9,936,000.00
3.1 Boulevard Commercial Area - Two Lane Urban Transitional	\$14,904,000.00	\$9,832,500.00
3.2 Boulevard Commercial Area - Four Lane Urban	\$16,146,000.00	\$10,350,000.00
4.1 Avenue Residential Area- Urban Two-Lane With On-Street Parking	\$14,386,500.00	\$9,315,000.00
4.2 Avenue Residential Area- Urban Two-Lane With Bike Lane	\$14,283,000.00	\$9,211,500.00
5 Avenue Commercial Area- Urban Two-Lane	\$14,904,000.00	\$9,832,500.00
6 Avenue Commercial Area- Urban Two-Lane with Off-Street Parking	\$8,487,000.00	\$9,004,500.00
7 Avenue Residential Area- Urban Four-Lane Constrained	\$14,593,500.00	\$9,522,000.00
8 Avenue Residential Area- Urban Four-Lane Divided	\$15,007,500.00	\$9,832,500.00
14 Rural Street	\$4,243,500.00	

These unit costs were then applied to each of the corridors included in the 2022 SAP Future Roadway Network Plan to develop a planning-level estimate. The cost for each roadway included on the future roadway network are provided in Attachment B. Right of way acquisition costs, as well as design and construction engineering inspection costs, *are not included* in these costs. Additionally, revenue sources have not been identified to fund this plan in its entirety. Therefore, the Plan should be viewed as an "aspirational plan" until funding sources are committed to the proposed improvements. Table 5 summarizes the estimated costs.

Table 5: Estimated Cost

Derek "Ted" Atkins, PLA, AICP Ref: 66535.00 18 July 2024 Page 8

Conclusion

This planning exercise was undertaken to support development of an updated mobility fee for Haines City. The expected growth in travel demands on Haines City's transportation system are derived from updated population growth forecasts, a refined model network, and desired infrastructure improvements identified within this memorandum. The results identified herein can be included as an addendum to the adopted Haines City CityView Special Area Plan Transportation Element Update and utilized to aid in the future decision making of relegated transportation improvements within the City of Haines City.

Past Five Years - Two "High-Cost" Improvements: 365,655

Sources: Polk County Transportation Division, June 1, 2022, and Duncan Associates, January 9, 2023.

Note: Cost adjustments by WEO-PE, from FDOT "Advisory Inflation Factors for Previous Years (1987-2018)

Osceola County "Mobility Fee Renewal Study" (HNTB, January, 2022) identifies a cost of (\$354.59 per person-mile x 2.44 persons/vehicle=) \$865.20/vehicle-mile, which is based on State construction costs -- on the high side due to only State costs.

City of Lakeland "Multi-Modal Transportation Impact Fee Update Study" (Tindale-Oliver, August, 2019) identifies a cost of (\$4,770,000 per Iane-mile/capacity of 10,400 vehicles per day =) \$458.65/vehicle-mile of capacity for non-State roads. Hillsborough County "Mobility Fee Update Study" (Tindale-Oliver, April, 2020) identifies a cost of (\$6,538,000 per lane-mile for County roads/9,091 vehicles per lane=) \$719.17 per vehicle-mile.

Seminole County (2021 Multi-Modal Mobility Fee, WEO-PE, 2021) cites Orange County construction costs from 2017 of (\$6,261,259 per lane-mile/capacity of 10,305 per lane=) \$607.59 per vehicle-mile. If adjusted for inflation by 1.09, cost would be \$662.27 Haines City would be constructing roads for municipal and County use, so using the recent-year Polk County cost of \$613.08 is chosen for the Haines City area.

^{1/} The FHWA estimates national trends by using State reported Highway Performance and Monitoring System (HPMS) data, fuel consumption data (MF-21), vehicle registration data (MV-1), other data such as the R. L. Polk vehicle data, and a host of modeling

2,103,539,415,503 85,753,746,714 Total Fuel (Light-Duty & MC): Miles per Gallon (Light-Duty & MC): Total VMT (Light-Duty & MC):

^{2/} Light Duty Vehicles Short WB - passenger cars, light trucks, vans and sport utility vehicles with a wheelbase (WB) less than or equal to 121 inches. Light Duty Vehicles cars, light trucks, vans, and sport utility vehicles regardless of wheelbase.

3/ Single-Unit - single frame trucks that have 2-Axies and at least 6 tires or a gross vehicle weight rating exceeding 10,000 lbs.

3/ Single-Unit - single frame trucks that have 2-Axies and at least 6 tires or a gross vehicle weight rating exceeding 10,000 lbs.

3/ Single-Unit - single frame trucks that have 2-Axies and at least 6 tires or a gross vehicle weight rating exceeding 10,000 lbs.

3/ Single-Unit - single frame trucks and at least 6 tires or a gross vehicle miles traveled = 1 person-rullal and at least 6 tires or a gross vehicle miles traveled = 1 person-rullal at a least 6 tires or a gross vehicle miles traveled = 1 person-rullal at a least 8 tires or a gross vehicle results.

Work Program Instructions

FY 24/25 - 28/29

September 8th, 2023

12) Turnpike Enterprise Programs

The turnpike enterprise analysis should include all turnpike funds and transportation system 02 (intrastate turnpike). Contingencies are determined by reports with turnpike funds only, and program level is determined as transportation system 02 (intrastate turnpike) excluding statewide funds (bridge and SIS described above).

d. General Assumptions

- Amounts included for contingency analyses only address contract class 8.
- 30% of district projects programmed using statewide funds for SIS and/or bridge will be considered as part of the district programmed level for contingency analysis.
- RBRP, SCOP, SCED, SCRC, SCWR, ARSC, SCRA, ARSR, GRSC, CIGP, CIGR, and TRIP will not be included in the box analysis.
- Earmark funds will be excluded if programmed as a contract class 5 or if programmed as a transportation system 06 or 16.
- SE funds will be excluded if programmed as a contract class 5.
- Boxed items for the Miami Intermodal Center (MIC) are not included in the box analysis, regardless of the funds programmed.
- LF funds on a contract class 8 will be included as a reserve account, regardless of box code.

e. Construction Cost Inflation Factors

Inflation factors for construction costs will be utilized in the development of the tentative work program as indicated below. These inflation factors will automatically generate the new estimates for anything gamed in WPA by applying these factors to the present day costs (PDC's) in WPA. All estimate changes must be made in the adopted file; do not make estimate changes in the proposed file (tentative work program development cycle). Shaded areas beginning in fiscal year 29/30 cover the 10-year period for the SIS program.

FISCAL	INFLATION		FISCAL	INFLATION	
YEAR	FACTOR	MULTIPLIER	YEAR	FACTOR	MULTIPLIER
24/25	2.9%	1.029	29/30	3.3%	1.203
25/26	3.0%	1.060	30/31	3.3%	1.243
26/27	3.1%	1.093	31/32	3.3%	1.284
27/28	3.2%	1.128	32/33	3.3%	1.326
28/29	3.3%	1.165	33/34	3.3%	1.370

Note: Base year is 23/24.

Notes:																

Notes:

- 1. Where more than one land use code is listed, the rate is an average of the land uses.
- After fourth County adjustment in June, 2026.
 County charges on a "per 1,000 s.f." basis, whereas City fee is by number of fueling positions.
